

Anomaly detection

→ DBSCAN

→ Elliptic Envelope

→ RANSAC

1) Min points \rightarrow 4
2) Epsilon (Radius)

Cone point \rightarrow If point p has $>$ min point
within epsilon radius
Border point
Noise point

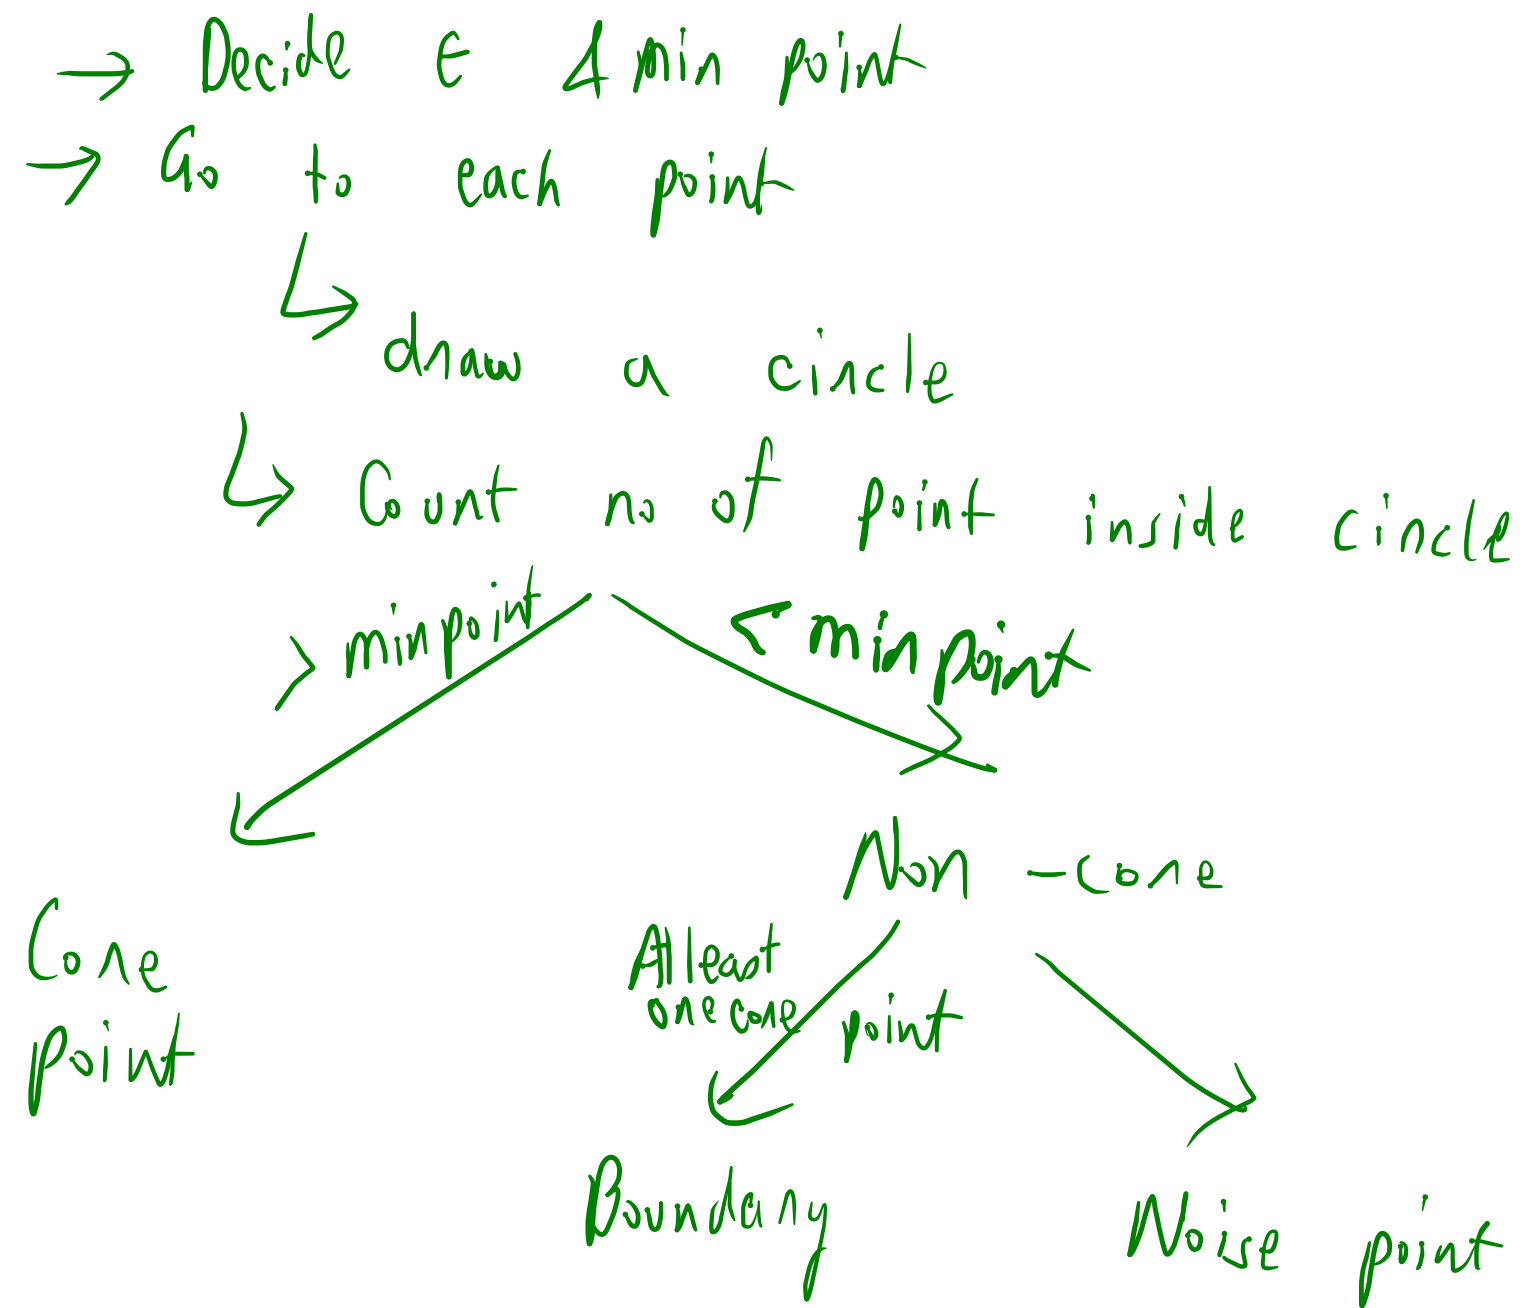

Border point \rightarrow It does not have minpts
 \hookrightarrow Atleast one core point in
epsilon radius

Noise point \rightarrow Neither core nor border
point

Core point

Border

Algorithm

1. Start with any arbitrary point which is not visited
2. Check for core point, border noise
3. If point is core point then cluster formation starts. So if the neighbour of this core point are also core point then these neighbour point will be added to the cluster and cluster grows

Pros

- Don't need to select K
- Can form non-spherical cluster
- Not sensitive to outliers.
- Require only 2 para: ϵ min point
- Can handle cluster of diff shape and size

Cons

→ Cluster is very sensitive to epsilon & min point

→ Offline algorithm

↳ No predict method

DBSCAN

1. Cluster can be any shape
2. No need to specify no of cluster
3. Insensitive to outlier

K-mean

1. Spherical
2. Specify
3. Sensitive

→ Break until 10:35pm

Anomaly detection

→ Anomaly (outlier)

↳ Not normal behaviour

→ Why outlier exist?

1) Human error/machine error

2) Real unusual data

↳ extremities

↳ New

Novelty : Something which hasn't been
seen before

Techniques for outlier detection

① → IQR

Outlier

$$\begin{aligned} < q_1 - 1.5 IQR \\ > q_3 + 1.5 IQR \end{aligned}$$

② Z-score

$$Z = \frac{X - \mu}{\sigma}$$

Outlier

{

$$Z < -3$$

$$Z > 3$$

3 σ

③ Percentile
