

When a paper doesn't describe their approach or link their code and only has benchmarks

Agenda

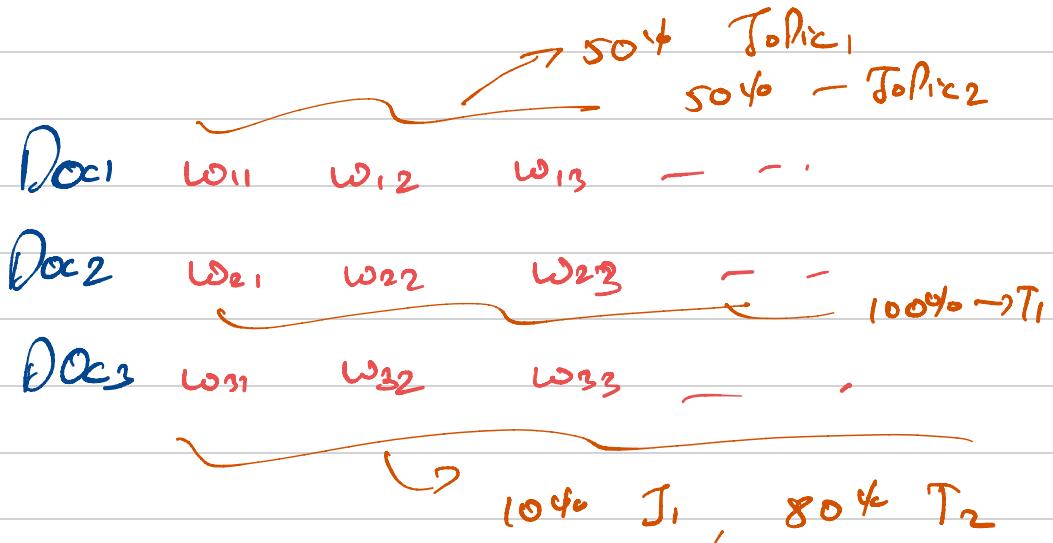

1. POS Tagging - What and How?
2. Topic Modelling - LDA

Nobody:
Me to Text to Speech
model for no reason

LATENT DIRICHILET ALLOCATION

2003

→ Problems with LDA → Bow model.

→ We have to choose no
of topics 12

Eg: 3

10012 → 3 topics per

DOC 1 →

- ↳ no context
- ↳ no Sequence
- ↳ Good/Great
 - ↳ Complete Sellerate

→ LDA works at a word level

$D_1 \rightarrow 10$ words

$\delta \rightarrow T_1$ } $60\% \rightarrow T_1$
 $u \rightarrow T_2$ } $40\% \rightarrow T_2$

Soft K-means Clustering

Sports - { "Football" - 0.4, "Fifa" - 0.7 }

→ Two Ways to measure LDA

① Doc / Topic matrix $\rightarrow D_{01} \rightarrow 60\% T_1$
 $40\% T_2$

② Topic / Word matrix
Bank \rightarrow Finance
 \rightarrow Environment

Apple \rightarrow Tech
 \rightarrow Food

Algorithm

① Allocate any topic randomly to all the words

2

$\rightarrow N$ iterations

For Each document:

For each word in doc w^i :

For
Each
Topic

① Ratio of word $w \rightarrow t_i$ $\frac{P(w/t_i)}{\text{All the words in } t_i}$

② Proportion of words in t_i For a document D $\frac{P(t_i/d)}{P(t_i)}$

③ Multiply

$$P(w/t_i) \times P(t_i/d)$$

Example:

- Doc1: orange - 50, soup - 50, diet - 20, concert - 30
- Doc2: apple - 40, health - 10, guitar - 50, music - 60
- Doc3: banana - 45, bread - 55, song - 25, festival - 35

topic 0 topic 1

$$\underline{12 = 2}$$

Document / Topic
matrix

| | Topic 0 | Topic 1 |
|------|---------|---------|
| Doc1 | 70 | 80 |
| Doc2 | 110 | 90 |
| Doc3 | 80 | 80 |

Topic word matrix

| | Topic 0 | Topic 1 |
|----------|---------|-------------|
| orange | 50 | 0 <u>50</u> |
| soup | 0 | 50 |
| diet | 20 | 0 |
| concert | 0 | 30 |
| apple | 0 | 40 |
| health | 0 | 10 |
| guitar | 50 | 0 |
| music | 60 | 0 <u>•</u> |
| banana | 45 | 0 |
| bread | 0 | 55 |
| song | 0 | 25 |
| festival | 35 | 0 |

260

50/260

210

70/150

= 0.089

$$① P(\text{Orange} | \text{to}) \times P(\text{to} | \text{d})$$

$$② P(\text{Orange} | \text{G}_1) \times P(\text{G}_1 | \text{d})$$

$$\frac{50}{260} \times$$

$$\downarrow \frac{70}{150}$$

= 0.10..

0.1 → Topic 1
